

Creating the HyperTree

Files

These 3 files must be implemented - [HyperTreeFiles.zip](#)

jit.js (a slightly modified version - supports rightclick of the original jit.js from <http://philogb.github.io/infovis/>) - Great work by <https://twitter.com/philogb>

init.js (also "homemade" from the original example code)

First

Add the 3 files to the page (or some page for reuse) - or get them from somewhere else:

Second

Create a Page and insert the HTML to load the files (Notice the 51118133 number will be different):

```
HTML

<script type="text/javascript" src="/download/attachments/51118133/jit.js"></script>
<script type="text/javascript" src="/download/attachments/51118133/init.js"></script>
<link type="text/css" href="/download/attachments/51118133/Hypertree.css" rel="stylesheet" />
```

Add the DIV Canvases to the Page:

```
HTML

<center><div id="log" style="display:none;"></div></center>
<div id="container">
  <div id="center-container">
    <div id="infovis"></div>
  </div>
  <div id="inner-details" style="display:none;"></div>
</div>
```

Third:

Config the Hypertree JSON Macro:

Edit 'Hypertree JSON' Macro

Preview

Page Title *

Atlassian Home

Space Key

atlassian

PageLevels

3

Select Macro

SaveCancel

Fourth:

Save the page and see the Hypertree 😊 like [HyperTree Sample](#)
