

Theme Plugins for Confluence

 Updated 15-07-2014 for Brikit+Theme+Press

Here I will try to "rate" - on a complete subjective basic - some Theme/style Plugins for Confluence

- [RefinedWiki Original Theme](#)
- [Enterprise Theme](#)
 - No valid Data Center license found
- [Zen Foundation](#)
- [Adaptavist Themebuilder](#)
- [Brikit ThemePress](#)
- [Overall conclusion](#)

RefinedWiki Original Theme

Marketplace listing

A fine plugin for spicing up a site or space relatively easy, with several very nice themes right out of the box, combined with a wide color range. A fair part of customizations are available for headers, footers and menus, as one of the best, this has a fixed with design, making up for the "Easy Reader Theme", lost in Confluence as of version 5

The designs are very usable, but I find the Dashboard links, breadcrumbing and links a bit confysing and also the language parts are quite poor. The theme has alternate styling for blog "dsfsdf" wich makes the blog lokking very bloglike, and very little confluence like; wich for my part is not good, as the blog looking is distancing it from the pages looking, as if I was actually using two seperate prodcuts.

The footer designer is pretty nice, but also quite limited, making the footer 90% of what You were aiming for (not nessesarily bad 😊). The Plugin makes it possible to create Your own designs, wich must be nice, but also quite timeconsuming. This theme also has a maximize content button ([Full screen function](#)), so the content can fill most of the browser, hiding menus and stuff, quite usefull in some cases where a page has a lot of content or needs to be viewed fullscreen (fullbrowser, anyway)

I have not tested the Dashboard part.

Conclusion: Very, very good if You can live with some limitations regarding design and footer. Somewhat confusing in linking. The [developers documentation](#) is very good.

Enterprise Theme

Maketplace listing

This is a very usable plugging with a bundle of [extra usable Macros](#) available, even if the Theme is not selected on a site, making is usefull with other themes.

The plugin has some strong blogpost macros as [gu-blog-posts](#) and [top-stories](#)

The design is rather flexible and the fact that You have a wiki markup "placeholder" - Called **Global Sections** - for both headers, footer, sidebars and below contant make it easy to set ind extra macros, contents and stuff, that would be relative diffecult to put in oterewise. Also, all the content placeholders can either just inherit from the global design (in the Confluence Admin section) or be maintained per site, very very flexiple.

Global settings	Altered for a space
-----------------	---------------------

Enterprise Theme - Edit global default sections

Header

Configure the header area (define the items which are displayed on every page for all users with the permission `editconfluencehtml`)

Save

Pageheader

Configure the header area (define the items which are displayed on every page for all users with the permission `editconfluencehtml`)

Save

Section below page content

Configure the section below the page content (define the items which are displayed on every page for all users with the permission `editconfluencehtml`)

Save

Pagefooter

Configure the footer area (define the items which are displayed on every page for all users with the permission `editconfluencehtml`)

Save

Section below page content

Configure the section below the page content (define the items which are displayed on every page for all users with the permission `editconfluencehtml`)

Save

Header

Create

Configure the header area (define the items which are displayed on every page for all users with the permission `editconfluencehtml`)

Pageheader

Create

Define the content for the page header.

Save

Remove

Section below page content

Create

Define the content, which are rendered below a page. (Attachments, Links, ...)

Save

Remove

Pagefooter

Create

Define the content for the page footer.

Section below page content

Create

Define the content, which are rendered below a page. (Attachments, Links, ...)

Header

Create

Configure the header

Red= Altered for the space

Blue=Inherits from the Global

The same goes for the "General configuration", also defined at the Confluence Admin level, and inherited to each space, where it can be altered for the space, breaking inheritance.

Also, quite some fair amount of styling is available, but customization of font sizes are completely missing, and the fonts set by the theme are rather small, this can be fixed (partly) with the following code in the Global HTML (or style page). *But of course, this is my subjective opinion*

Show code

```
/* Enterprise Theme font corrections */
.wiki-content h1 {font-size: 35px; }
.wiki-content h2 {font-size: 30px; }
.wiki-content h3 {font-size: 25px; }
.wiki-content h4 {font-size: 21px; }
.wiki-content h5 {font-size: 17px; }
.wiki-content p {font-size: 15px; }
.wiki-content a, .wiki-content a:link, .wiki-content a:visited { color: #538011; text-decoration: underline; }
.wiki-content a:hover { color: #000000; }
.block-element-recently-updated .recently-updated-sidebar a {font-size: 15px; }
```

No valid Data Center license found

Please go to [Atlassian Marketplace](#) to purchase or evaluate Refined Toolkit for Confluence Data Center.
Please read this [document](#) to get more information about the newly released Data Center version.

Also, the theming and the sidebars are very flexible for admin to set design, and some very special features as "Set as landing page" versus the default "Embed page View" are very nice and gives users a good impression on hitting a page (this is customizable per page):

As the name Enterprise indicates, this theme is meant for business, more than public facing or "pleasure" - so there are no integrations to social medias like facebook, twitter or similar.

Conclusion: An excellent plugging, but the small fonts and missing Style Designer gives it some heavy limitations. The [developers documentation](#) is very poor, but the plugin is relative intuitive.

Zen Foundation

Marketplace listing

Definitely a strong pluing with one of the largest cusomizations possibilities, which - for my part - also makes it the one not to use, and the customizations is very timeconsuming.

Secondly, the out of the box designs are so ugly, that You feel like giving up instantly; but this is what "professionals" often use for making more public sites, when compeding agains typical CMS rivals as Joomla, Drupal etc etc

Awarded several times:

- Atlassian Marketplace Top 10 Add-ons of 2012
- 2012 Atlassian Summit Launchpad Winner
- Top Selling Atlassian Marketplace Add-on (FY 2012)
- 2011 Atlassian Summit Launchpad Winner
- 2010 Atlassian Cool Plugins Award
- 2010 Best of Confluence Award

Used - among others, here:

- <http://hub.ampliance.com> 
- <http://facebook-presence.com> 
- <http://www.mindmercatis.com> 
- <https://company.payjunction.com/support> 
- <http://stepstonetech.com> 
- <http://truelove.onconfluence.com>  (demonstration site)

Conclusion (very subjective after a short test): Probably an excellent product, but be prepared to take on a time-consuming task to design Your style (s). As a private focusing on content rather than nitty gritty design, I kind of "resigned" on the plugin.

Adaptavist Themebuilder

@Adaptavist

I cant say that I have tested this (very) much; my first disappointment is that out of the box, nothing is prepared, preloaded or added - the ROOT Theme is basically just a copy of the Confluence 5 Theme.

I have not read the manual or attended the Webinar (yet), but I am somewhat disappointed. Most other theme's - and especially RedefinedWiki has a some (or a lot of colors), fonts, a new footer etc, just waiting to be enabled; this is not the situation with ThemeBuilder. I would have loved 5 to 10 skins - or just a "installed with sample skins" or a "get samples here" big red button...

Oppositite to the Enterprise Theme, ThemeBulder works with "Storage Format" - aka xhtml, and as with Zen, the whole getting in business takes quite an effort; You dont just jump into the product. It's for sure a compeditor to Zen as both products are for those who want to brand their Confluence to the Max; typically for Internet faced sites.

I like the possibility to make N number of skins and the inherit part; but I am sure it gets very complicated to maintain at some point.

Conclusion (very subjective after a short test): Probably an excellent product, but as with Zen, be prepared to take on a time-consuming task to design Your style(s). As a private focusing on content rather than nitty gritty design, I kind of "resigned" on the plugin.

Brikit ThemePress

Brikit Theme Press

To be honest, I never got it right - spent some 1/2 hour figuring it out. A minus could be that my other Theme plugins and custom CSS fucked it up a bit (should have been tested on a clean instance) - but I never got the idea in the Layout and building block pages - and I do hate plugins that twist standard Confluence things and change their behavior - suddenly the "Edit" button did it a bit different and a new menu item on the Tools appeared: Edit entire page - Followed by a warning about this was only for certain procedures as copy page etc...

The videos seems nice and the documentation appears well at first sight, but I never got it....

Overall conclusion

No theme can be branded as a winner, for that the themes are way to different, and each covers a part of what the need You may have.

Zen Foundation and **Adaptavist ThemeBuilder** (and perhaps **Brikit Theme Press**) is for sure the leading products if You want to go all the way, whereas **Enterprise Theme** in general is quite "portal"/Internet aming. **RefinedWiki** is easiest for making a quick and nice look in overall, and with a Designer for making Your own themes, something the users of Enterprise Theme may miss after a while.
