

# Home Assistant

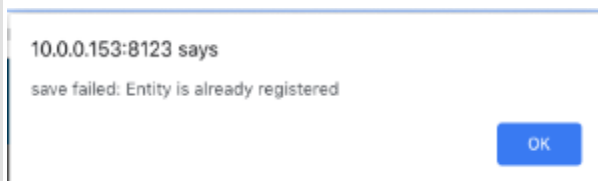

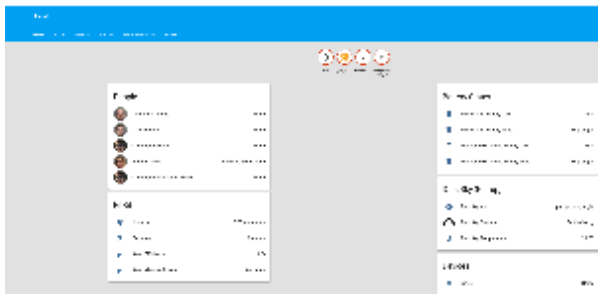

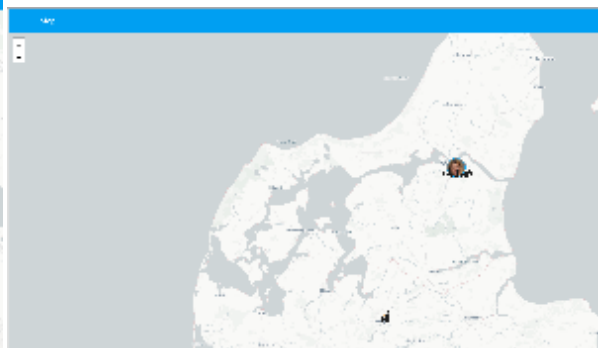

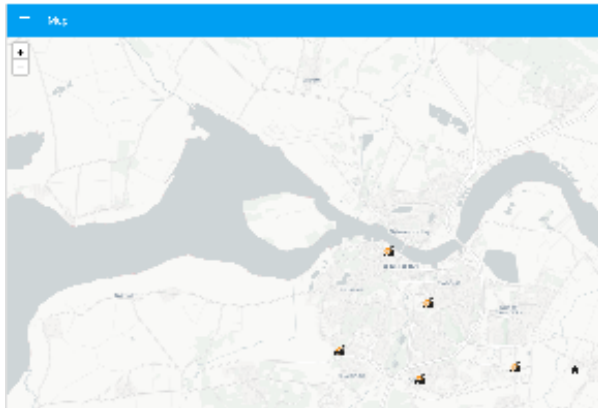

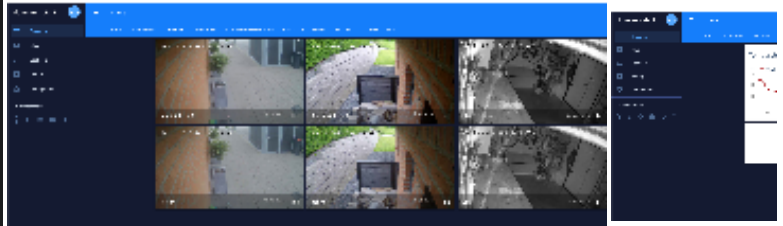

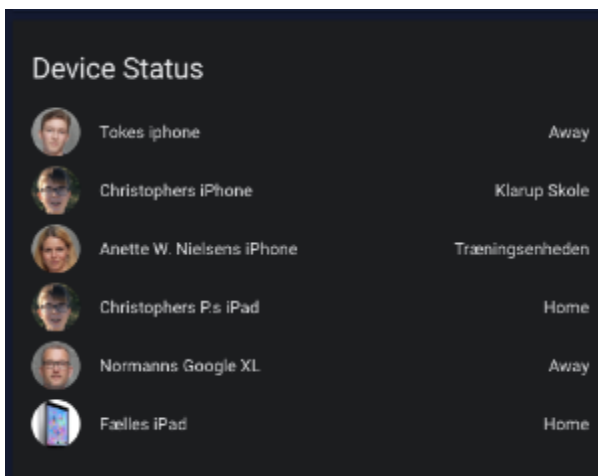

## TIP

Home Assistant is an alternative to [openHAB](#). Home Assistant is python/yaml based and quite nerdy to setup. Also, several devices support are quite wierd and not well-fuctioning in my opinion.

After a short test, I left Home Assistant in favor of [openHAB](#)

## Screenshots

## Type

Home Assistant can be executed on several types of hardware (Laptop, NAS, Raspberry Pis) and methods (Native, Docker, HASS Image), I do prefer Docker:
