

Confluence User Macro - Getting the Request string

Fetches from <https://confluence.atlassian.com/display/DOC/Include+Page+Macro>

```
#set ($qString = $req.getQueryString())
#set ($titleStart = $qString.indexOf("title=")+6)
#set ($nextAmpIndex = $qString.indexOf("&", $titleStart))
#if ($nextAmpIndex == -1)
#set ($titleEnd = $qString.length())
#else
#set ($titleEnd = $nextAmpIndex)
#end
#set ($reqTitle = $qString.substring($titleStart, $titleEnd))
```

Very nice for getting the params from a QueryString - I am thinking of making a "Show Image" page in the [Mos-Eisley Gallery](#), using QueryString params
